Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 The source of this protein was an extrachromosomal plasmid.

The source of this protein was an extrachromosomal plasmid.

The precursor is cleaved by endogenous proteinase activity to form igner (fragment A) and heavy (fragment B.C) chains that are covalently linked by an interchain disulfide bond (the individual chains are not toxic when separated). The amino end of the heavy chain (fragment B) can be separated from the carboxyl end (fragment C) by papain.

Fragment B forms ion channels in a lipid bilayer. Fragment C bind; to gangliosides and may target the toxin to the motor end plate Fragment A is a zinc-dependent endopeptidase.

This potent neurotoxin binds to peripheral neuronal synapses, is internalized, and moves by retrograde transport up the axon into the spinal cord where it can move between postsynaptic and proteolytic cleavage of synaptobrevin (vesicle-associated membrane protein 2).

#description The sequence of 55 kb on the left arm of yeast chromosome;
identifies 28 open reading frames including 18 unknown among which a new putative serine/threonine protein kinase a homologue to the human phosphotyrosyl phosphatase activator PTPA and a homologue to the plant pleiotropic regulator PRL1 of PP1 and PP2a phosphatases.

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

scale 0.953

Variance 25.693;

Mean 24.484;

-! FUNCTION: THE 26S PROTEASE IS INVOLVED IN THE ATP-DEPENDENT
DEGRADATION OF UBIQUITINATED PROTEINS. THE REGULATORY (OR ATPASE)
COMPLEX CONFERS ATP DEPENDENCY AND SUBSTRATE SPECIFICITY TO THE
26S COMPLEX (BY SIMILARITY).

-! SUBCELLULAR LOCATION: CYTOPLASMIC AND NUCLEAR (POTENTIAL).

-! SIMILARITY: BELONGS TO THE AAA FAMILY OF ATPASES.

SUBMITTED (JAN-1997) TO EMBL/GENBANK/DDBJ DATA BANKS.
-! FUNCTION: THE 26S PROTEASE IS INVOLVED IN THE ATP-DEPENDENT DEGRADATION OF UBIQUITINATED PROTEINS. THE REGULATORY (OR ATPASE)
COMPLEX CONFERS ATP DEPENDENCY AND SUBSTRATE SPECIFICITY TO THE 26S COMPLEX (BY SIMILARITY).
-! SUBCELLULAR LOCATION: CYTOPLASMIC AND NUCLEAR (POTENTIAL).
-! SUBCELLULAR INCATION: THE AAA FAMILY OF ATPASES.
-! SIMILARITY: BELONGS TO THE AAA FAMILY OF ATPASES.

SUBMITTED (JUL-1995) TO EMBL/GENBANK/DDBJ DATA BANKS.
C.!- FUNCTION: THE 26S PROTEASE IS INVOLVED IN THE ATP-DEPENDENT
DEGRADATION OF UBIQUITINATED PROTEINS. THE REGULATORY (OR ATPASE)
COMPLEX CONFERS ATP DEPENDENCY AND SUBSTRATE SPECIFICITY TO THE
26S COMPLEX (BY SIMILARITY).
COMPLEX (BY SIMILARITY).
C.!- SUBCELLULAR LOCATION: CYTOPLASMIC AND NUCLEAR (POTENTIAL).
C.!- SIMILARITY: BELONGS TO THE AAA FAMILY OF ATPASES.
C.!- SIMILARITY: BELONGS TO THE AAA FAMILY OF ATPASES.

"Nucleotide sequence of yellow fever virus: implications for flavivirus gene expression and evolution.";

SCIENCE 229:726-733(1985).

-!- FUNCTION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

-!- SUBUNIT: THE VIRION OF THIS VIRUS IS A NUCLEOCAPSID COVERED BY A LIPOPROTEIN ENVELOPE CONSISTS OF TWO PROTEINS:

PROTEIN M AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.

"Nucleotide sequence comparison of the genome of two 17D-204 yellow

T ever vaccines.";

NUCLEIC ACIDS RES. 17:3989-3989(1989).

LIPORCHION: THE SMALL PROTEINS NS2A, NS2B, NS4A AND NS4B ARE

HYDROPHOBIC, SUGGESTING A POSSIBLE MEMBRANE-RELATED FUNCTION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL RNA REPLICATION.

NS3 AND NS5 MAY PLAY A ROLE IN THE VIRAL COVERED BY A LIPOPROTEIN ENVELOPE CONSISTS OF TWO PROTEINS:

LIPOPROTEIN AND GLYCOPROTEIN E. THE NUCLEOCAPSID IS A COMPLEX OF PROTEIN C AND MRNA.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              This SWISS-PROT entry is copyright. scale 0.946

Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

                                                                                or inducing MHC Class II mediated activation of T cells
Disclosure; Columns 33-34; 29pp; English.

The present sequence, a pan DR binding peptide, is capable of
binding antigen binding sites on MHC molecules, which are encoded
by most of the alleles of a DR locus. The peptide can be used to
inhibit or induce MHC Class II mediated activation of T-cells or
helper T-cells, which themselves mediate a CTL response. The
peptide can be used in mammals, especially humans, to inhibit
T-cell-mediated events involved in allograft rejection, allergic
responses and autoimmunity and as a vaccine adjuvant for enhancing
an immune response against an administered immunogen. The peptide
can be used with other immunogens to treat, e.g. prostate cancer,
hepatitis B, hepatitis C, AIDS, renal and cervical carcinoma,
lymphoma, CMV and condylyloma acuminatum.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Gaps

The (G+C) content of the synthetic gene is increased by 47% wrt the (G+C) content of the synthetic gene is increased by 47% wrt that in the content of the sequence. This eliminates six "terminator" regions which were found to be present in (A+T) rich regions. The terminators (termination/endo-nucleolytic processing/polyadenylation sites) were previously responsible for incomplete transcription of the mRNA. The elimination of these elements (using codon degeneracy) provided for successful expression in yeast of the tetanus toxin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         yeas

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  use as vaccines.

Claim 1; Page 17; 20pp; English.

Epitopic peptides may be used with synthetic hapten derive a pathogen to generate an immune response to the pathogen. Peptides are recognised by numerous T-helper cell clones with context of a wide range of alleles of the human MHC. The peptides may be used in an antimalarial vaccine induciresponse to P.falciparium.

DNA encoding laminary pentose forming enscale recombinant production
Claim 1; Pages 7-9; 10pp; Japanese.
The DNA encoding the present sequence, Slaminary pentose forming enzyme, is usefrecombinant production of the enzyme.
Sequence 401 AA;
 Score 82;

Example; Fig 2; 32pp; English.

The inventors claim a recombinant enzyme prepr. comprising beta-1,
3-glucanase or a mutant or variant and a vector contg. DNA encoding
it under the control of an exogenous promoter pref. lac UV5. The
it under the native beta-1, 3-glucanase gene isolated from
example uses the native beta-1, 3-glucanase gene isolated from
oerskovia xanthineolytica genomic DNA and expressed in pUV5-G1S.

The present sequence represents yeast (Saccharomyces cerevisiae)
The present sequence represents yeast (Saccharomyces cerevisiae)
Totelin disulphide isomerase (PDI). The present invention describes a biologically active recombinant yeast PDI, in which the endoplasmic reticulum localisation signal (His-Asp-Glu-Leu) at the C-terminal is defective or lacking, is produced by: (a) modifying a gene encoding the natural PDI by adding, deleting or substituting one or more bases in the part of all of the localisation signal fails; (b) inserting this modified gene into a suitable vector (such as the yeast expression vector YEPIGII); (c) transforming a host cell with the vector; (d) culturing the transformant at a pH near to neutrality (preferably at pH 6.5 to 8.0), and (e) isolating the PDI from the culture medium. PDI is used in the processing of foods such as ham, sausages, fish products and bean-curd (tofu). The modified PDI retains its biological activity by simple purification methods in high yield.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              ESULT 11

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      New composition containing pectin methyl esterase and two substrates

Induces gealing in foodstuffs having less than 50% soluble solids
content, used for, e.g. preparation of foodstuff from fruits

Disclosure; Page 44; 29pp; English.

A composition has been developed which comprises a pectin methyl
cortiginate in situ from the other. The present sequence represents a PME
from Aspergillus aculeatus. Also described in the present invention are:

(1) a method of preparing the above composition by forming a mixture of
a PME and two PME substrates either one of which does not originate in
situ from the other; (2) a process comprising adding to a PME substrate,
a PME and another PME substrate, where neither PME substrate originates
in situ from the other; (3) a process of imparting stability to a
reaction medium comprising a PME substrate, by adding at least 1 PME and
a second PME substrate, where neither PME substrate originates in situ
from the other; (4) an aqueous system being in a solidified gel state
and having a soluble solids content of less than 50% w/w, where the
gelling has occurred by use of a high ester PME substrate; and (5) a
codstuff comprising or prepared from or by the invention. The methods
characterists are used in the preparation of foodstuff from materials.

PT Stabilising protein in acidic soln. - by adding enzymatically de-esterified pectin, produced using pectin methylesterase

PS (laim 44; Page 75; 114pp; English.

CC This 220-amino acid polypeptide comprises an N-terminal extension sequence of orange pectin methyltransferase (PME). The extension cc is located N-terminally to the signal peptide of the PME (W12661) encoded by PME cDNA clone p034 (151739). The 64 kDa longer (L) isoform of PME is believed to be more heat stable than the 36 kDa shorter (L) isoform. Isoform S is believed to start the initial shorter (L) isoform. Isoform S is believed to start the initial compartability to a protein.

CC The 220-amino acid extension can be used to impart or increasing heat stability to a protein.

The process is advantageous over prior art in that it comprises addition a second PME substrate which will overcome problems associated with differing quantities and qualities of PME substrates.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               esterase

T stabilising protein in acidic soln. - by adding enzymatically de-esterified pectin. produced using pectin methylesterase

T de-esterified pectin. produced using pectin methylesterase (PME)

T de-esterified pectin. produced using pectin methylesterase (PME)

T de-esterified pectin. - by adding enzymatically de-esterified comprises a novel orange pectin methylesterase (PME)

T dolypeptide comprises a novel orange pectin methylesterase (PME)

C that can be obtained by expression of the PME coding sequence contained in NCIMB 40750 or of a CDNA clone (T51739) obtained from a norange fruit cDNA library. A longer isoform (see W12662) of the PME was also identified. Recombinant PME can be expressed in a contained method for de-esterifying a pectin. The de-esterified pectin is used in claimed methods for stabilising a protein in a codic environment (such as fruit juice, drinking yoghurt or drinks containing whey or milk proteins) without adversely affecting the viscosity of that environment. The recombinant enzyme can also be viscosity of that environment. The recombinant enzyme can also be viscosity of that environment. The recombinant enzyme can also be viscosity of that environment. The recombinant provel PME
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                from
